I. Executive Summary

The Maine Biennial Hazardous Waste Report for 2011 and 2012 has been prepared by the Maine Department of Environmental Protection to fulfill the requirement of 38 M.R.S.A. § 1319-Q(2) for biennial reporting on the generation, transportation, and handling of hazardous waste in Maine.

The report indicates that during calendar years 2011 and 2012, respectively, 27,799,704 pounds and 18,952,319 pounds of hazardous waste were generated in Maine. These totals include hazardous waste generated from manufacturing and commercial activities, as well as hazardous wastes generated from clean-up/remediation projects in Maine.

Two commercial hazardous waste facilities licensed in Maine to accept wastes from other generators, handled 647,135 pounds and 898,842 pounds of hazardous waste from Maine generators in 2011 and 2012, respectively. As of December 2012, there were eighty-four (84) facilities licensed in Maine to handle, treat or store hazardous waste, including two (2) commercial storage facilities, one (1) commercial treatment and storage facility, fifty-one (51) facilities licensed for beneficial reuse on-site, and twenty (20) other facilities for a variety of site-specific licensed activities. Seventeen (17) licenses were issued or renewed in 2011 and seventeen (17) licenses were issued or renewed in 2012. No license revocations occurred in 2011 or 2012.

Only 40,399 pounds of hazardous waste was imported from out-of-state generators to Maine commercial hazardous waste facilities in 2011, while 412,194 pounds of hazardous waste was imported in 2012. Although fluctuations in the amount of imports are not uncommon, and can be attributed to many different variables, it appears the increase seen between 2011 and 2012 is due to the import of petroleum-contaminated waters from the State of Massachusetts that were generated during remedial projects.

A total of 27,055,666 pounds of hazardous was exported from Maine generators to out-of-state facilities in 2011, and a total of 18,442,034 pounds of hazardous waste was exported in 2012. Lists of facilities and firms providing hazardous waste transportation, licensed disposal and other services are provided in the report.

An assessment of the hazardous waste generation trends for Maine from 2002 through 2012 indicates that yearly waste generation totals, which include waste from hazardous waste remediation projects, vary greatly year-to-year, but that hazardous waste generation from manufacturing and commercial activities (excluding remediation projects) is relatively consistent, decreasing only slightly since 2002.

II. Introduction

The Maine Biennial Hazardous Waste Report for 2011 and 2012 has been prepared by the Maine Department of Environmental Protection (“Department”) to fulfill the requirements of 38 M.R.S.A. § 1319-Q (2) for biennial reporting on the generation, transportation, and handling of hazardous waste in Maine. The requirements of 38 M.R.S.A. § 1319-Q(2) include biennial reporting on the following: (1) amount of hazardous waste by type generated, handled and transported in Maine; (2) the amount of hazardous waste by type handled at commercial hazardous waste facilities in Maine; (3) the number of hazardous waste facility permits by type currently active, granted and revoked; (4) the amount of hazardous waste imported from out-of-state generators to in-state hazardous waste facilities, and the amount of hazardous waste generated in Maine exported to out-of-state facilities; (5) a list of hazardous waste facilities in Maine and out-of-state available for use by generators in Maine; and (6) a list of known firms, i.e. licensed hazardous waste transporters, which provide testing, consulting, brokerage, transportation and other services to generators in Maine.

This report includes manifest data from shipments of hazardous waste from all facilities that generated and shipped hazardous waste in 2011 and 2012. This includes facilities that are regulated in Maine’s three categories of hazardous waste generators: Small Quantity Generators, Small Quantity Generator Plus, and Large Quantity Generators. Small Quantity Generators (SQGs) generate up to 100 kilograms or 220 pounds per month and cannot accumulate more than one 55-gallon drum or 440 pounds on site at any one time. SQGs have the fewest regulatory requirements. Those in the Small Quantity Generator Plus (SQG Plus) category have the same monthly generation restrictions as SQGs, but can accumulate up to three 55-gallon drums or 600 kilograms of hazardous waste on site at any one time. SQGs Plus have regulatory requirements in addition to those that SQGs must adhere to. Large Quantity Generators (LQGs) generate more than 100 kilograms or 220 pounds per month or accumulate more than 600 kilograms on site at any one time. This report also includes waste quantities from “one-time generators” of hazardous waste. Examples of one-time generation of hazardous waste include site remedial activity and underground gasoline storage tank removals.

Hazardous waste information was compiled from the Department’s hazardous waste manifest database. All facilities that ship hazardous waste, regardless of quantity, are required to submit a hazardous waste manifest to the Department. Department staff enters shipment information from the manifests into the Department’s manifest database. The unit of measure used in this report for the quantity of waste is pounds. The hazardous waste quantities reported on the manifests which are not reported in pounds (i.e. gallons, liters, etc.) are converted to pounds using conversion factors based upon the type of waste. This report does not include hazardous waste generated and treated on-site under abbreviated treatment licenses since this waste is not transported or documented on manifests, is not entered into the manifest database, and is a relatively minor amount compared to the shipment data. This report also does not include information about waste oil or bio-medical waste generation or shipment. This report includes data and information on universal wastes, reported separately than hazardous waste, including information on universal waste recycled under manufacturer take-back programs.

III. Waste Generation

In 2011, 27,799,704 pounds of hazardous waste and in 2012, 18,952,319 pounds of hazardous waste were generated and shipped by Maine generators. Universal wastes, a sub-category of hazardous waste which includes fluorescent lamps, cathode ray tubes, mercury switches and other wastes, are not included in the

totals reported in Tables 1 - 4 and Figures 1 - 5. Data related to the recycling efforts for universal wastes are reported and discussed in this report, beginning on page 12 and in Table 5 and Figures 6 - 10.

Table 1 shows the quantities of hazardous waste generation in Maine for 2011 and 2012 by generator type, while Figures 1 and 2 illustrate the percentage of hazardous waste shipped by generator type for 2011 and 2012, respectively. Generator types in Table 1 include: LQGs and SQG Plus; One-time Generators; and SQGs.

Table 1

Hazardous Waste Shipping Information from Manifests

Generator Type	Quantity in Pounds	Quantity in Pounds
	2011	2012
LQGs and SQGs Plus	24,819,837	17,063,882
One-time Generators	2,639,932	1,590,687
Small Quantity Generators	339,936	297,749
Total	27,799,704	18,952,319

Figure 1
2011 Hazardous Waste Generation

Figure 2
2012 Hazardous Waste Generation

Table 2 provides, by waste types, the quantity of hazardous waste generated in pounds for 2011 and 2012. For a graphical representation of this same data, see Figures 3 and 4. It should be noted that the data in Table 2 and Figures 3 and 4 represent an approximate breakdown of hazardous waste quantities by waste types. The reason for the approximation is that many waste items can be reported under more than one waste type. For example, chemical oxygen demand test vials contain both corrosive chemicals and metals. For waste items where more than one waste code was reported, the quantity is accounted for under the first waste type listed for the waste item described on a manifest.

Table 2

Total Quantity of Hazardous Waste Generated in 2011 and 2012 by Waste Types

Waste Types (Codes)	Quantity in Pounds	Quantity in Pounds
	2011	2012
Ignitable (D001)	4,161,334	4,566,065
Corrosive (D002)	1,683,490	1,412,835
Reactive (D003)	7,305	13,196
Metals & Pesticides (D004-D017)	13,706,818	8,379,929
Federal TCLP organics (D018-D043)	430,228	192,824
Recycled plastic with cadmium (D006)	52,953	52,829
Non-specific source wastes (F-wastes)	274,832	376,262
Specific source wastes (K-wastes)	73,470	27,497
PCB's over 50 ppm (M002)	7,287,959	3,886,710
Acute wastes (P-wastes)	2,757	7,326
Toxic wastes (U-wastes)	118,561	36,844
Total	27,799,704	18,952,319

Figure 3
2011 Hazardous Waste by Waste Types

Figure 4
2012 Hazardous Waste by Waste Types

IV. Waste Generation Trends

The Department analyzed hazardous waste trends since 2002 for SQGs, SQGs Plus, and LQGs, as illustrated in Figure 5. Two different sets of data and corresponding trend lines are plotted in the graph below.

The upper trend line is the total amount of hazardous waste generated in Maine, which includes hazardous waste from manufacturing, commercial activities, and site remediation. This trend varies considerably from year to year depending on the number of remediation projects underway during each year and the volume of clean-up wastes generated from such projects. For example, the peaks that occurred in 2003 and 2007 were a result of major remediation or clean-up projects. The peak in 2003 was primarily the result of two major clean-up projects - one involving the Eastland Woolen Mill superfund site in Corinna, Maine, where 14,242,000 pounds of soil contaminated with the chlorinated solvent chlorobenzene were removed, and the second involving the National Semiconductor Corporation facility in South Portland, Maine where 6,654,000 pounds of soil contaminated with chlorinated and non-chlorinated solvents were removed as a result of remediation activities. The peak in 2007 was primarily due to remedial action projects which generated approximately 3 million pounds of mercury-contaminated concrete and other construction related materials removed from the Holtrachem site in Orrington as part of the continuing site clean-up project, and approximately 2 million pounds of lead-contaminated wastes removed from the Portsmouth Naval Shipyard site in Kittery. In 2011 more than 11.5 million additional pounds of lead contaminated wastes were removed from the Portsmouth Naval Shipyard in Kittery and in 2012 more than 2 million pounds of lead contaminated wastes were removed from the shipyard site. Additionally, in 2011 more than 5 million pounds, and in 2012 more than 3 million pounds of PCB contaminated soils were removed from the Callahan Mine Superfund Site in Brooksville.

The lower trend line in the graph shows hazardous waste generated from manufacturing and commercial activities since 2002, excluding site remediation wastes. Some increases were reported from 2011 to 2012 for individual generators, but many other generators reported decreases in wastes generated. The overall trend indicates that hazardous waste generated from all manufacturing and commercial activities has decreased very slightly since 2002.

Figure 5
Hazardous Waste Generation Trends Analysis

V. Licenses and Abbreviated Licenses

As of December 2012 there are eighty-four (84) hazardous waste licenses in effect. This includes fifty-one (51) Beneficial Reuse On-site, five (5) Reuse in solid form, three (3) Treatment in Tanks, six (6) Precious Metal Recovery, four (4) Transfer Facility, one, (1) Elementary Neutralization, two (2) Commercial Storage, one (1) Commercial Treatment and Storage, two (2) Post Closure and three (3) Electronic De-manufacturing licenses. Seventeen (17) licenses and abbreviated licenses were issued or renewed in 2011 and seventeen (17) were issued or renewed in 2012. A complete listing of the companies by license type can be found in Appendix A.

VI. Import/Export Information

Imports

Approximately 40,399 pounds in 2011 and 412,195 pounds in 2012 of hazardous waste were imported into Maine from other states for treatment or recycling. ENPRO Services of Maine (ENPRO) in South Portland was the receiving facility for 99% of the imported hazardous waste in both years. ENPRO is federally regulated and licensed by the Department to treat gasoline and oil-contaminated water and to store hazardous waste for subsequent transport to other facilities licensed for treatment or disposal. Additionally, Portsmouth Naval Shipyard in Kittery imported hazardous waste from out-of-state military

facilities to store for subsequent transport to facilities licensed for treatment or disposal. Portsmouth Naval Shipyard imported 302 pounds in 2011 and 985 pounds of hazardous waste in 2012 from out-of-state military facilities. Portsmouth Naval Shipyard is also federally regulated and licensed by the Department to receive and store hazardous waste from other military facilities. Table 3 contains the amounts of hazardous waste that were imported from other states during the reporting period. The amount of waste imported is based on the wastes that are deemed hazardous in the State of Maine, and does not include waste deemed hazardous in another state or country, if that waste (i.e. waste oils) is not considered hazardous waste in Maine. Imports from Massachusetts increased significantly from 2011 to 2012 and is mainly due to the import of petroleum-contaminated waters that were generated during remedial projects. However, fluctuations in the amount of imports are not uncommon. Over several reporting periods, the amount of hazardous waste imported has not had a singular trajectory. Some years the numbers have increased, while other years have seen significant decreases in the amount of hazardous waste imported into the state.

Table 3
Hazardous Waste Imported from Out of State or Canada

State/Country (from)	Total in pounds	Total in pounds
	2011	2012
Connecticut	0	0
Massachusetts	22,044	404,806
New Hampshire	2,659	1,857
New York	0	0
Rhode Island	0	0
Vermont	15,696	5,532
Canada	0	0
Total	40,399	412,195

Exports

Of the 27,799,704 pounds of hazardous waste generated and shipped by Maine generators in 2011, 97% (27,055,666 pounds) was exported to other states and Canada for treatment, storage, or disposal. Of the 18,952,319 pounds generated in Maine in 2012, 97% (18,442,034 pounds) was exported to other states and Canada. For a complete breakdown of wastes exported to other states and Canada, see Table 4 below.

Total	27,055,666	18,442,034

VII. Maine Waste Handled at Commercial Hazardous Waste Facilities in Maine

In 2011, 647,135 pounds of hazardous waste generated in Maine and in 2012, 898,842 pounds of hazardous waste generated in Maine was shipped to licensed treatment or storage facilities (TSF), i.e. commercial hazardous waste facilities, within the state. ENPRO Services of Maine in South Portland received approximately 644,132 pounds of Maine-generated waste in 2011 and 889,953 pounds in 2012 of Maine-generated waste consisting primarily of waste gasoline and water mixtures. Other than the gasoline-contaminated wastewater treated on-site, the remaining hazardous waste (primarily waste gasoline) received by ENPRO is ultimately sent out of state for treatment and/or disposal. Additionally, Portsmouth Naval Ship Yard, a licensed storage facility, receives hazardous and universal wastes from other military facilities (to store, bulk, and subsequently ship to licensed treatment or disposal facilities) and in 2011 received approximately 3,003 pounds of hazardous waste and in 2012 received approximately 8,889 pounds of hazardous waste generated at military facilities located in Maine.

VIII. Hazardous Waste Facilities

A listing of commercial hazardous waste facilities within the United States, based on 2011 biennial report data, is available online at www.epa.gov/osw/inforesources/data/br11/index.htm. There are three federally regulated commercial hazardous waste facilities in Maine. They include two commercial storage facilities licensed by the Department: Central Maine Power in Augusta (for PCB wastes generated by CMP) and Portsmouth Naval Shipyard in Kittery (for waste generated by military facilities); and one licensed commercial treatment and storage facility, ENPRO Services of Maine in South Portland which treats gasoline and oil-contaminated wastewaters that have the characteristic for ignitability.

IX. Transporters

Maine's hazardous waste generators are required to ship their wastes using licensed hazardous waste transporters. Transport companies apply to be licensed annually by the Department. The majority of transporters are full-service entities that also provide testing, consulting, and other services associated with transportation and disposal of hazardous wastes. The Department licenses the company, the conveyances, and the conveyance operators. Driver's records are reviewed. The companies, once listed, are placed on a list of licensed transporters which is available to the public. A complete list of transporters, their site and mailing addresses, and phone numbers is supplied in Appendix B and is available on the Department's web site at www.maine.gov/dep/maps-data/documents/activehaztrans.pdf.

X. Universal Waste

The Universal Waste category was created to encourage the proper management and recycling of these wastes. A universal waste is a hazardous waste that is specifically designated as a universal waste because it is widely generated. Small businesses that typically do not generate other hazardous waste do generate universal waste.

Universal wastes include mercury or lead containing lamps (Sodium Vapor, HID or fluorescent), mercury thermostats, cathode ray tubes (CRTs), non-leaking polychlorinated biphenyls (PCBs) lamp ballasts, mercury devices such as mercury thermometers and switches, mercury switches from automobiles, and

certain batteries. Data on the quantities of universal waste items collected at municipally-owned central accumulation facilities, and at sites sponsored by the Rechargeable Battery Recycling Corporation (RBRC), The Big Green Box, and the Thermostat Recycling Corporation (TRC), is included in this report. This data may include household waste which meets the description of universal waste, including electronic devices containing circuit boards.

Universal waste shipments are tracked by either a log system, through the use of Uniform Bills of Lading (UBOLs), or reports from manufacturer take back programs. The UBOLs are entered into the Department's manifest database. Universal waste can be collected at central accumulation facilities (company or municipally owned) and commercial consolidation facilities before being shipped to a recycling facility. Universal Waste going to a recycling facility must be documented on a UBOL. The Department compiled the data for this report by reviewing the manifest database, reports from the TRC, The Big Green Box, and RBRC manufacturer take back programs, and reports of motor vehicle mercury switch collections from the Alliance of Automobile Manufacturers, Subaru, the Truck Manufacturers Association and the Recreational Vehicle Industry Association. Table 5 lists the number of universal waste items that were shipped for recycling or disposal from 2005 through 2012. Figures 6 and 7 show the number of items in a bar graph format. The number of lamps, CRTs and electronic devices is depicted separately in Figure 7 because the total number of those items vastly outnumber the other categories. The pie charts contained in Figures 8 and 9 display the percentages of each type of universal waste per year. Figure 10 illustrates the total number of all universal waste items that have been sent for recycling for the years 2003 through 2012. The graphs clearly show the increases in recycling of electronic devices and CRTs in 2011 and 2012. The large spike in handling electronic devices in 2011 is caused by e-Waste Recycling Solutions (a licensed electronics demanufacturing facility) shipping over one million electronic devices to a New York recycling facility. The spike of CRTs in 2012 is caused by e-Waste Recycling Solutions receiving more than 1.6 million CRTs at its facility, including CRTs from out-of-state facilities.

Table 5
Universal Waste Items Recycled or Disposed by Type

Type of Universal Waste	Total Number of items	Total Number of items	Total Number of items	Total Number of items	Total Number of items	Total Number of items	Total Number of Items	Total Number of Items
	2005	2006	2007	2008	2009	2010	2011	2012
Mercury or Lead Containing Lamps	819,689	671,349	962,685	988,574	1,014,425	954,330	1,048,020	901,523

XI. Conclusion

The Department's analysis of hazardous waste generation trends from 2002 to 2012 indicates that there has been a slight overall decline in the amount of hazardous waste generated in Maine, with significant annual variability due to materials generated by individual site remediation projects. However, the amount of hazardous wastes that are managed as universal wastes and recycled has increased ten-fold since the mid-2000's. Although some hazardous wastes are imported to licensed Maine facilities, the data from Tables 3 and 4 shows that the vast majority of Maine's hazardous waste is exported to other states.
